Kitten Vaccines

Vaccines are to be given in three week intervals. Felines that are strictly indoors that are **not** exposed to cats that are outdoor or spend time outdoors can discontinue the FELV vaccine. After completing a risk assesment the administration of FIV will be determined. All felines that have a positive fecal need to be rechecked. Recheck fecal exams may be done at different times depending on the type of intestinal parasite found. Spays and neuters will be completed at 6 months of age along with a declaw if needed unless the doctor specifies otherwise. Handouts and estimates are to be given on the last visit and blood work can be completed at that time (blood work may also be completed 3-5 days prior to the scheduled surgery date. Cite test should be confirmed at the time of surgery (clients do not have to complete this, but should be made aware of FELV latency stages).
