

Puppy Vaccine Protocol

All Visits are with an examination except the finals for the older dogs--Please see below. Vaccines are to be given in three week intervals. If a canine has a positive fecal, a recheck fecal exam is needed. Recheck fecal exams may be done at different times depending on the type of intestinal parasite found. Spays and Neuters are completed at the age of 6 mths unless doctor specifies other wise. Blood work is to be completed 3-5 days prior to the scheduled surgery date and can be done on the day of the final series of vaccines. Handouts and estimates should be given on the final visit.
